

ABSTRACT

An apparatus and method for the application of ultrasound to a location within the body is provided. The apparatus can advantageously operate at a pulse
5 duration below about 100 milliseconds and in the range 0.1 milliseconds to 100 milliseconds and a pulse repetition period below about 1 second and in the range of 1 millisecond to 1 second. Duty ratios over 5 and preferably over 8 are also advantageous. Therapeutic applications of ultrasound such as for assisting in the treatment of medical conditions such as cancer and/or other ailments are also
10 provided.
